

My website lets a user select whether their nutrition goal is to lose weight, gain weight, or eat more healthy snacks. Then the site will pull curated websites from the internet that provide recipes that may be helpful in their nutrition journey. This website is useful so users don't have to worry about vetting reliable sources themselves. It's interesting and engaging because I illustrated a character named Ben who helps users find information, so hopefully users feel more intrigued and don't get bored of the process. The target audience is adults 18 and up. I think this would be the best-suited audience for me in particular

To interact with the site

1. Hit the 'play' button on the first page
2. Click any nutrition goal (choose from the three buttons on the bottom of the screen)
3. Press next
4. Click on your gender
5. Input your weight in pounds and click next
6. Input your weight in ft and inches and click next
7. Click on an eating habit that describes you
8. Click great
9. Select a meal from the options on the right to be redirected to

Name of tool

I used animations from Modernizr's web animation API and an AOS library and I utilized a bootstrap template.

Why you chose to use it?

My site's tone is lighthearted, and the API's sliding animations matched the tone and Bootstrap makes styling a bit easier.

How you used it?

In my CSS and JS

What it adds to your website?

Adds fun and engaging animations for the user and allows the site to adapt to any browser.

Compared to Assignment 7, the design changed slightly in how recipes are displayed on the last page of the flow. I chose to embed articles from websites directly.

My biggest challenge was making my site responsive. I was not familiar with that technique starting out, but I found Bootstrap provides responsive templates which helped me a lot.
